

Impact Model: Story Arc Tracker

1. Current Problem

In a typical workflow, analysts and researchers spend a large portion of their day manually tracking news updates, regulatory filings, and market developments. Reviewing roughly 15–20 articles daily takes about 1.5 to 2 hours, with additional effort required to connect events, track sentiment, and identify key signals.

2. What the Solution Changes

The Story Arc Tracker automates this process end-to-end. It ingests data from multiple sources, structures events into a timeline, maps relationships between entities, and highlights sentiment shifts and forward-looking signals. What previously required manual effort is delivered as a structured output in under a minute.

3. Measurable Impact

A conservative estimate shows that each analyst can save approximately 1.5 hours per day. For a team of 40–50 analysts working 22 days a month, this translates to roughly 1,300 to 1,650 hours saved monthly. Assuming an average cost of ₹350–₹400 per hour, the monthly savings range between ₹4.5 lakh and ₹6.5 lakh. On an annual basis, this leads to savings of approximately ₹55 lakh to ₹78 lakh.

4. Additional Benefits

Beyond direct cost savings, the system improves decision-making speed, reduces the risk of missing critical developments, and allows analysts to focus on higher-value strategic work. It also enables a more engaging and structured way of consuming business news.

5. Assumptions

The estimates above are based on typical analyst workflows, an average of 15–20 articles reviewed daily, and standard industry cost benchmarks. The model intentionally uses conservative values to ensure realistic projections.
